

## GI Auditor's Kit

The GI Auditor's Kit is independent of both the main application itself – the GI Reporting Tool – and its data. It is a Microsoft Access database that contains the framework of forms, queries, report layouts and code needed to audit data recorded in the GI Reporting Tool.

Queries are grouped by perspective – patient, procedure or operator – and allow you to set a wide range of query-specific criteria. The wide range of reports include colonoscopy completion rates, instrument usage, complications, summaries of malignancies and those focussing on patients with HNPCC. FAP or gene carrier
